Protecting LiteBlue
Multifactor authentication now required

To protect employees and the organization from cybercriminals, the Postal Service will require multifactor authentication (MFA) for access to LiteBlue after Jan. 15.

Multifactor authentication is an *identity verification method* in which users provide two or more confirmation factors to gain access to an online account. It is frequently used by banks and other institutions dealing with sensitive personal information.

When employees log into LiteBlue, they will be required to set up their MFA preferences. Once an employee's MFA setup is enabled, these ID confirmation factors will be required each time he or she logs in.

Employees can click on "Multifactor Authentication" on the LiteBlue login page at **www.LiteBlue.usps.gov** for more information and to view support materials.
